Computer Upgrades

If your machine is getting a bit tired and you find it will not work with the latest applications, games, etc or is just a bit slow because of the age of the computer, we can offer a number of different upgrade paths.Â These range from just increasing the system memory to supplying a completely new machine.Â A general rule for upgrading is; what do you wantÂ to use the computer for and with what applications?Â A cost-effective upgrade that gives new life to older machines is to replace the older mechanical hard disk with a modern Solid State Disk (SSD). These are much faster than their older counterparts and will give a very noticable speed increase.
